

# Intro

For my final project, I decided to update my portfolio to fit the single page website format. In it, I have added additional information on what I have learned over the years including Python,C++, Html, Javascript, and Css. I also have added some Apis and Databases to show my knowledge on what they are and how to add them into a website.I will use React to build the website and have styled it using Tailwind. Also, since this is one page, I will add links to certain parts of the page and add a scroll effect in javascript so it does not just jump to the section.
